PTSD Research Paper Thesis Statements

Period 1
Approximately 5 million people in the U.S. suffer from Post-Traumatic Stress Disorder; therefore, it is a misconception that only veterans suffer from PTSD. There are many causes for developing PTSD, and different parts of the brain are involved. This mental disorder greatly affects and changes an individual’s life. PTSD is treated medicinally and psychologically.

Period 2
Post-Traumatic Stress Disorder is described as an anxiety disorder. It occurs as a result of any trauma defined as life threatening. 10-18% of troops are likely to develop PTSD when they return from active duty. Combat stressors are a leading cause of PTSD in veterans. Healthcare professionals have deemed PTSD difficult to diagnose, because certain symptoms must be present. There are many options for treatment, including medicine and talk therapy.

Period 5
Post-Traumatic Stress Disorder is a mental illness resulting from a traumatic event. Nearly ten percent of people in the United States may develop PTSD during their lifespan. Children, women, veterans, and minorities are at a higher risk of developing PTSD. Symptoms vary due to the severity of the traumatic event. There are a number of psychological and medicinal treatments for PTSD.

Period 8
Post-Traumatic Stress Disorder is a severe mental illness caused by a traumatic experience. Seven to eight percent of people in the U.S. may develop PTSD. PTSD patients suffer in different ways, including, but not limited to, bursts of anger, flashbacks, anxiety, and thoughts of suicide. Psychotherapy and medication reduce the symptoms of PTSD. In order to find out what causes PTSD, researchers are studying how the brain copes with fear.
